Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    900
                                                                                                                                                   The present invention relates to a method of producing extracellularly secreted, active, correctly folded, recombinant tissue plasminogen activator (FPA), Kringle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants. Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vein thrombosis or related diseases associated with unwanted blood clotting. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                    Producing active, correctly folded recombinant tissue plasminogen activator, Kringle 2 serine protease in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal

activator (AAR96222) in which the kringle KI domain (AAR96221) of plasminogen replaces the native KI domain of tissue plasminogen activator (tPA) (AAR96220). It was obtd. by inserting a synthetic plasminogen KI domain DNA (AAT27586) into tPA cDNA and can be expressed in transformed Escherichia coli RRI cells (FERM P-9272). Novel plasminogen activators are produced that show increased clot lysing specificity or plasma half-life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A DNA construct (AAT27587) codes for a novel plasminogen activator (AAR96223) in which the kringle K1 domain of plasminogen (see also AAR96221) is mutated to substitute asparagine for aspartic acid at position 5, and replaces the native K1 domain of tissue plasminogen activator (tPA) (AAR96220). It was obtd. by mutagenesis of the sequence in vector Zem99-8000 (see also AAT27587). The novel protein can be expressed in Escherichia coli REI/Zem99-8010 cells (FERM P-9315). Novel plasminogen activators are produced that show increased clot lysing specificity or plasma half-life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tissue plasminogen activator; tPA; alpha2-plasmin inhibitor; fibrinolytic; thrombolytic; fibrin; thrombosis; blood clotting; protein engineering; kringle; ss.

Plasmid encoding the modified tPA is 99-6300 and its transformant is E.coli RR1.-Zem 99-6300 (FERM P-9127).

This modified tPA, used to treat thrombosis, is of high quality and has a longer half life period in blood.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          It is modified in the patent by replacing one or more codons specifying a positively charged amino acid. The resulting analogues are inserted into a replicable expression vector which is used to transform or transfect a host cell which is grown to express a t-ph analogue. The t-ph analogue is useful for the treatment of diseases or disorders associated with the formation of thrombi in blood vessels e.g. infarctions, thrombosis and embolism. The analogue, in the 1-chain form, exhibits the properties of a proenzyme; however on plasmin-catalysed clasvage of the one-chain form, the activity of the 2-chain form is fully retained. Compared to native t-ph, it has a higher fibrin selectivity, as the fibrinogenolytic activity induced by the analogue is reduced relative to that induced by native 1-chain t-ph. (Updated on 25-MAR-2003 to correct PA field.)

                                     A cDNA clone of human tissue plasminogen activator (tPA) was amplified by PCR using the primers given in AA087368-69. The amplified tPA DNA (AA087370) was ligated into vector KS+ to obtain plasmid TPA-KS+. The construct was used in combinatorial methods involving RNA splicing-mediated shuffling of tPA domains improved thrombolytic properties.

The present sequence represents the human tissue plasminogen activator gene. It was used to construct plamsid TPA-KS+, which is used in the course of the invention. The specification describes a purified reverse oblicing intron which comprises a segment comprising a reverse-splicing intron which comprises a segment comprising a sequent of a group II intron, including an exon binding site not naturally present in the intron and a second segment comprising a parent of a group II intron, including a domain V motif, a branch site acceptor, and a nucleophilic group for transesterifying a phosphodiester bond of an RNA. Together the two segments form an a ucocatalytic Y-branched intron which catalyses integration of at least the first segment into substrate RNA by a reverse splicing reaction. The reverse-splicing introns are used, by specific cleavage and ligation of discontinuous nucleic acid, to generate new genes and gene products, e.g. ribozymes (for use in gene therapy or as reagents in DNA manipulation, e.g. replacements for restriction enzymes) or immunologically active or signal-transducing proteins such as antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence was obtained from cDNA prepd. from mRNA extracted from bowes melanoma cells. The cDNA was used to construct a gene library which was screened with a partial t-PA cDNA clone. Plasmid pKG12 was isolated and shown to comprise the whole coding region for human t-PA as well as 102b 5'flanking, 760 bp 3' flanking DNA and a poly A tail.

(Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          785
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CTCACCGAGTCGGGTGCCTCCTGCCTCCCGTGGAATTCCATGATCCTGATAGGCAAGGTT 120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
